

Project Design Phase - I

Solution Architecture

Date	18 October 2022
Team Members	Sanjay T, Saran A, Saravanakumar D, Siva Sudharasan K
Project Name	Project – Smart Farmer-IoT Enabled Smart Farming Application
Maximum Marks	4 Marks

- ✦ The different soil parameters (temperature, humidity, Soil Moisture) are sensed using different sensors, and the obtained value is stored in the IBM cloud.
- ✦ Arduino UNO is used as a processing unit that processes the data obtained from sensors and weather data from weather API.
- ✦ Node-red is used as a programming tool to wire the hardware, software, and APIs. The MQTT protocol is followed for communication.
- ✦ All the collected data are provided to the user through a mobile application that was developed using the MIT app inventor. The user could make a decision through an app, whether to water the crop or not depending upon the sensor values. By using the app they can remotely operate the motor switch.
